VLOGGER HTML INSTRUCTIONS

Welcome to the instruction manual for the HTML template. This document will help you through the setup of your website.

Structure of the Project:

Files of the HTML version:
1. index.html
2. archive.html
3. archive-videos.html
4. page-slideshow.html
5. single-video.html
6. single.html

How to edit the files?
For Windows, you can use Notepad++
For MAC, Sublime, Atom or Brackets are good editors (http://brackets.io/)

Changing colors
This project is realized in SCSS on the base of the materializeCss framework (http://materializecss.com) and extended with the QT framework. **The main SASS file is /sass/qt-main.scss.**

The best way to customize the colors is to edit the files:
* ./sass/components/color
* ./_ custom_colors.scss

Then compile the file qt-main.scss and put the output in **./css/qt-main.css**

Changing font families
Edit the file ./css/qt-typography to change font families associated with titles and contents.

Javascript libraries

This template uses several javascript libraries for effects and interactions. They are all loaded at the end of the html, before the closing of the body tag.
The default version of all the libraries is included, and the custom code is contained in the file
./js/qt-main.js

Framework:

This template is based on the materializeCss framework (http://materializecss.com).

Other libraries contained in the "components" subfolder:

Carousels: slick.js
Skrollr: https://github.com/Prinzhorn/skrollr

Copyright

Libraries:

Material framework: materializecss.js
https://materializecss.com
Carousels: slick.js
https://github.com/kenwheeler/slick
